

In-class: Chapter 9

1. Calculate the values of x and y under different parameter passing methods.

```
int x=5, y=10;
void f1(int a, int b)
{
    a = a + b;
    b = y + b;
    x = x + 1;
    y = y + 1;
}
main()
{
    f1(x, y);
    printf("x=%d y=%d\n", x, y);
}
```

- (a) Call-by-value: x= _____ y= _____
- (b) Call-by-value-result: x= _____ y= _____
- (c) Call-by-reference: x= _____ y= _____
